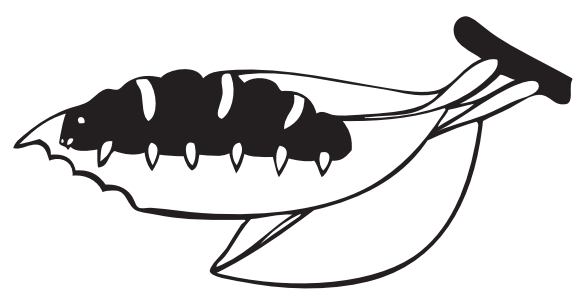
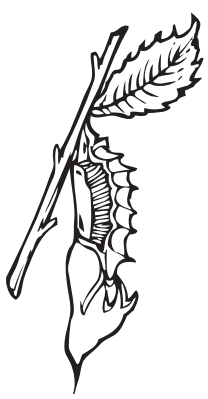
A life cycle is a process an organism goes through from life to death. The following are the stages in the life cycle of a butterfly.

Egg – This is the first stage of the life cycle.

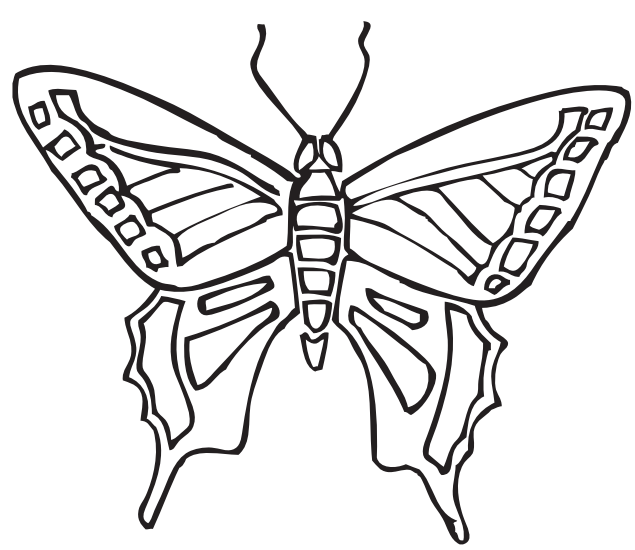
Larva- This is the second stage where the caterpillar grows and eats.



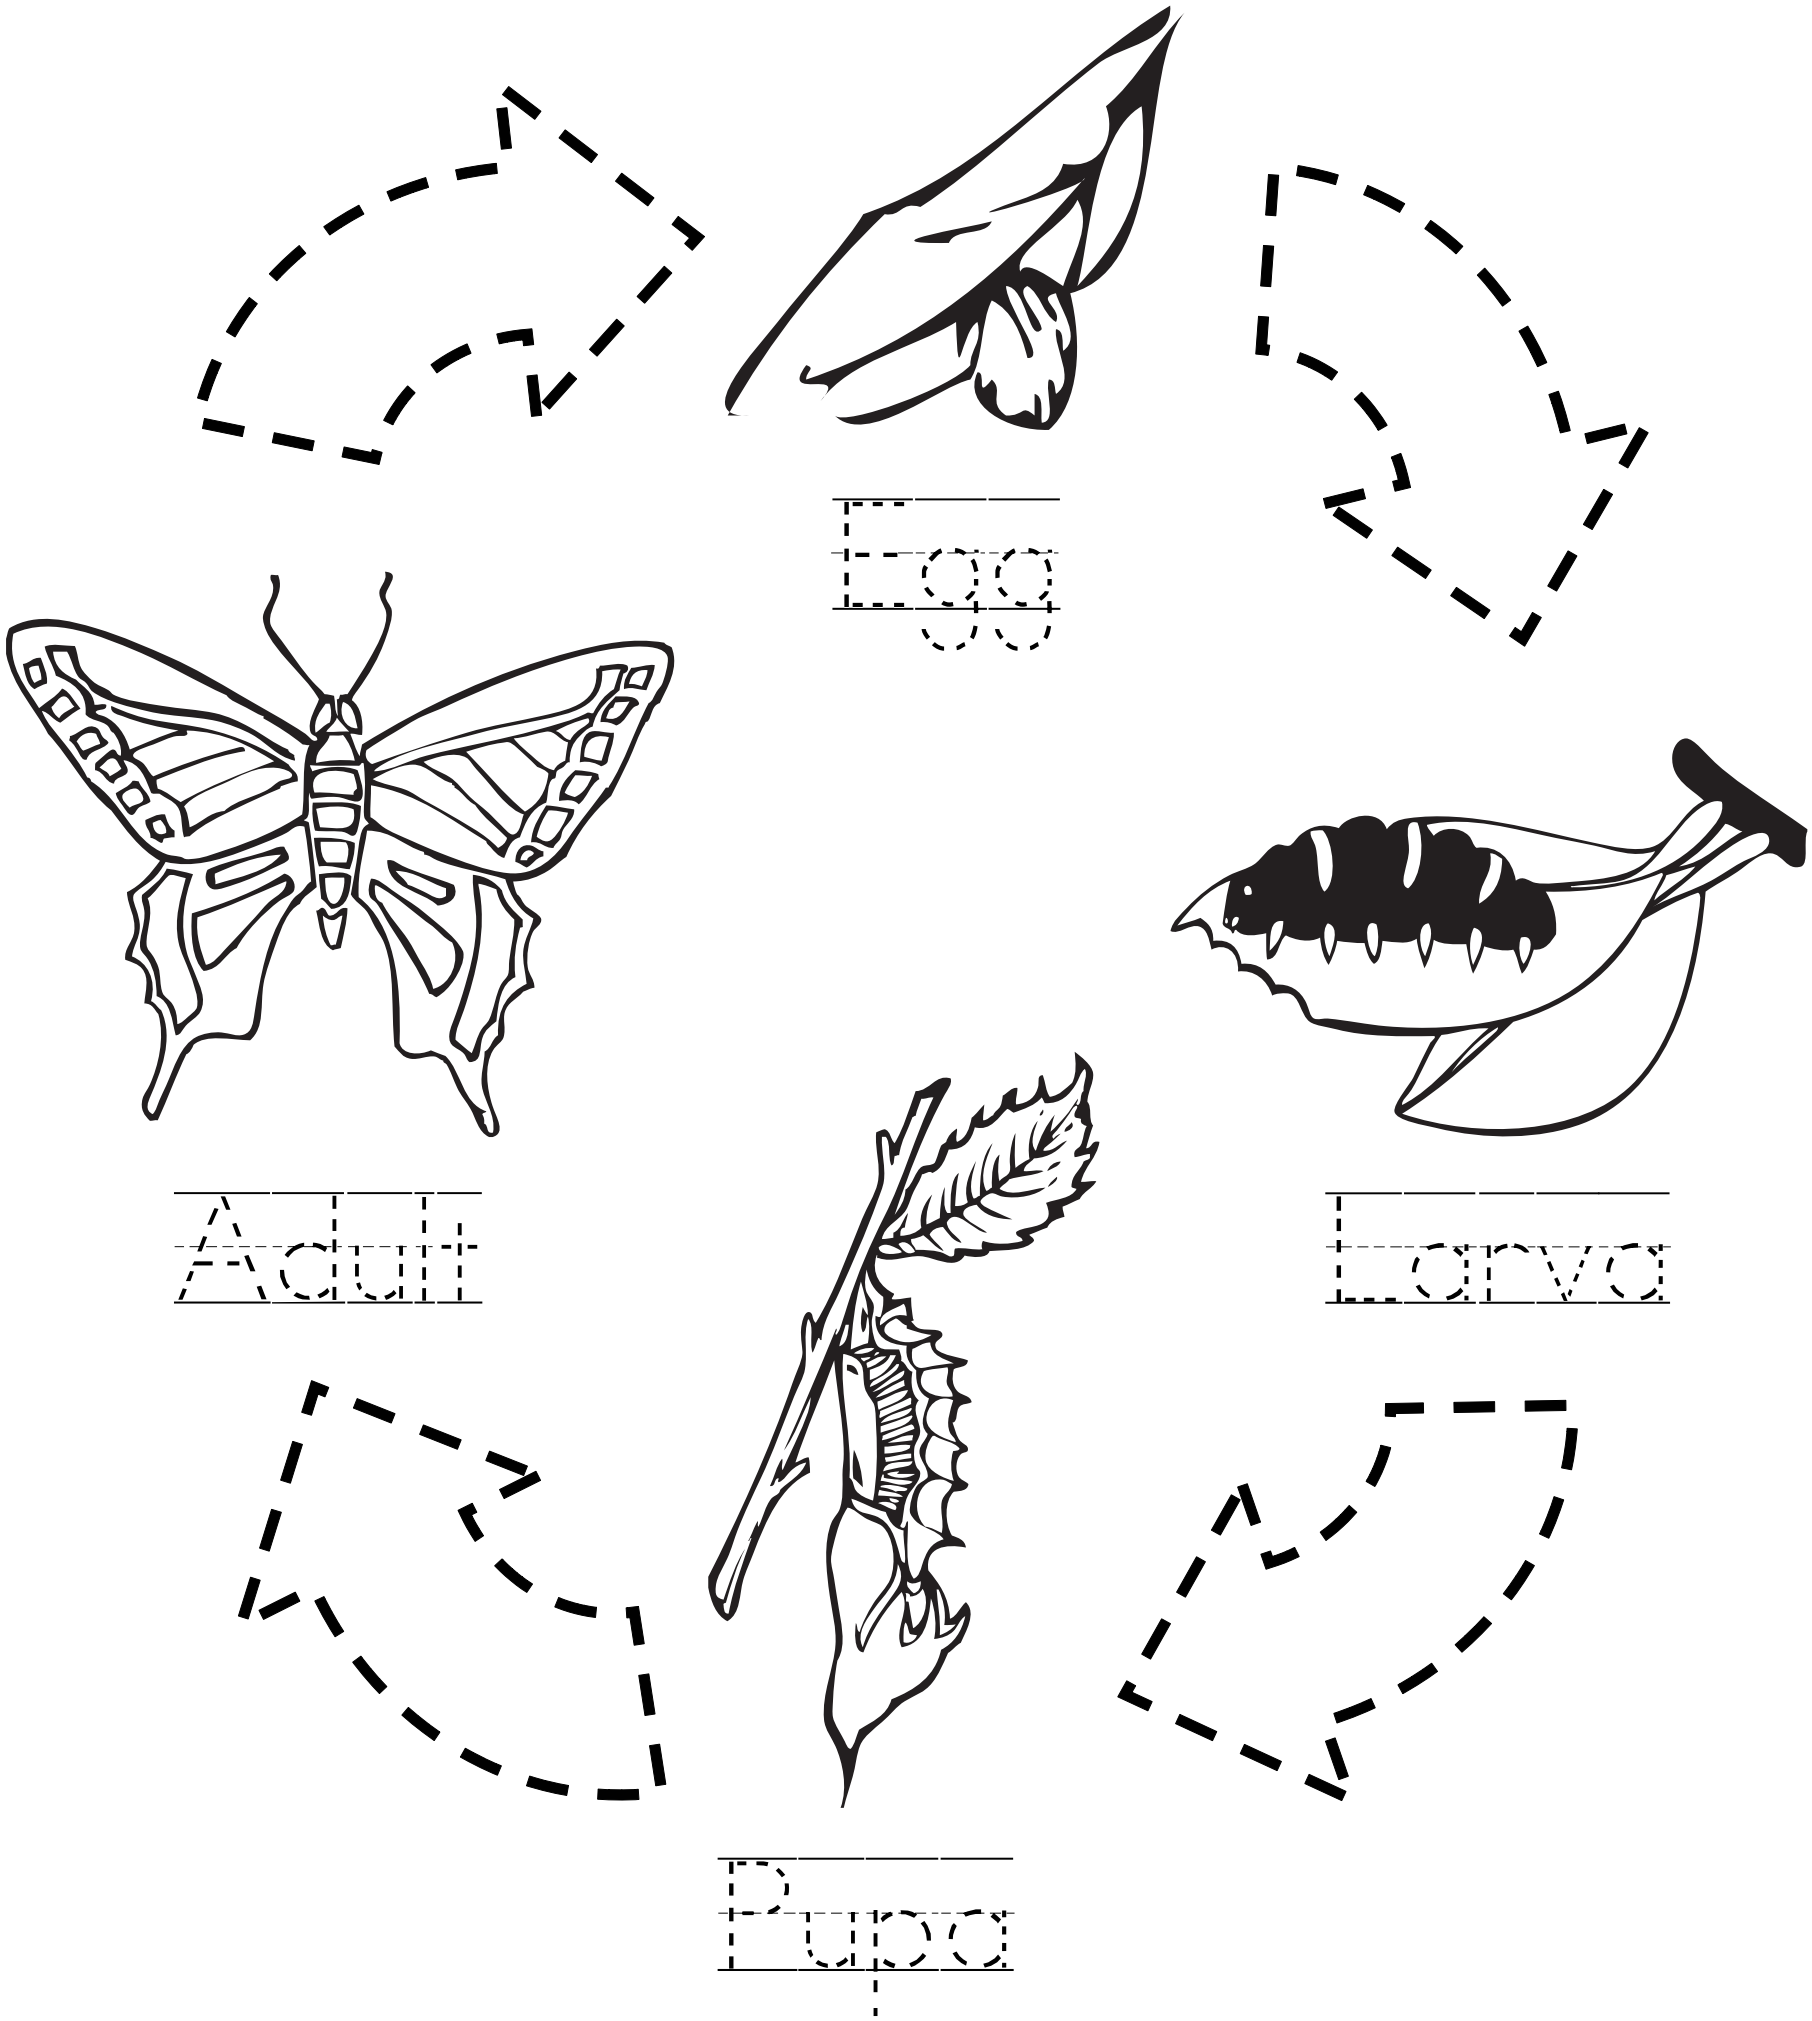


Pupa- This is the third stage in which the caterpillar rests and changes into a butterfly.

Adult- This is the last stage when the butterfly is ready to fly off, feed, and lay its eggs.



The four stages in the butterfly life cycle are shown below.
It is called a cycle because it repeats as time goes on.



Life Cycle

Trace the steps of the life cycle.

The egg is the first stage of the life cycle.

The life of a butterfly begins with an egg.

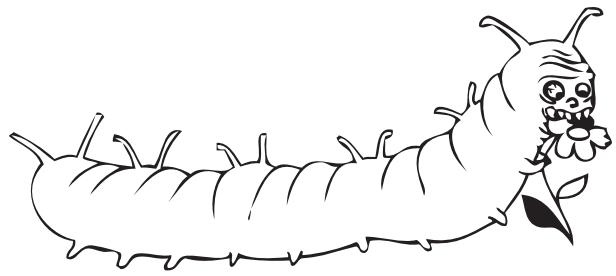
These eggs are all shapes and sizes and can be laid alone or in groups.

Some butterfly eggs hatch about four days after they are laid.

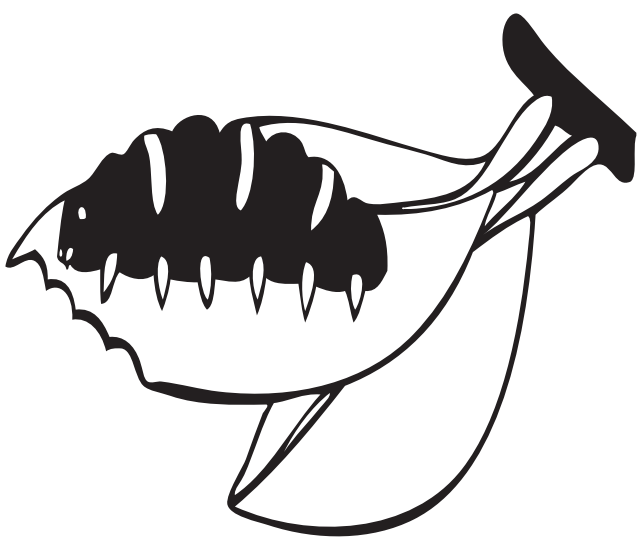
Egg - Stage 1

Trace the dotted words.

The larva is the second stage of the life cycle.



The butterfly or moth is a caterpillar in this stage.



In this stage, butterflies do all of their growing; this is often just about all that they do.

These "eating machines" take few breaks; not even to rest.

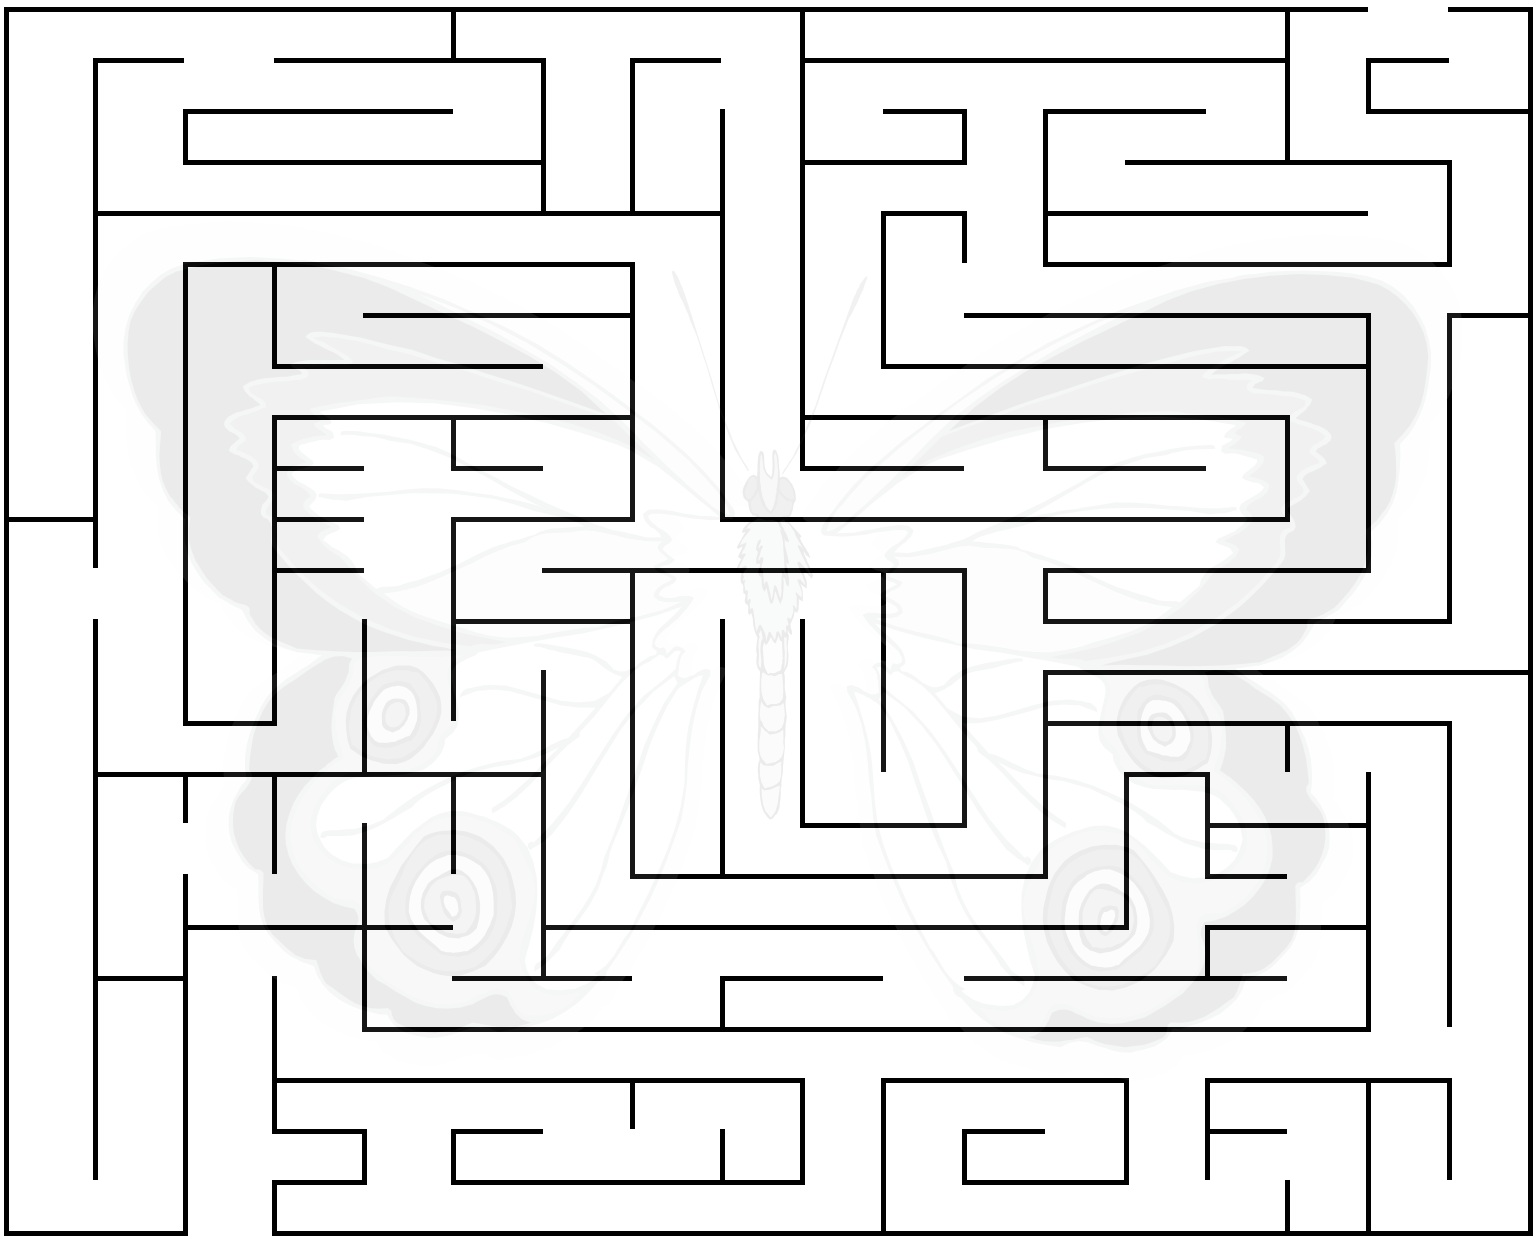
Larva - Stage 2

Trace the dotted words.

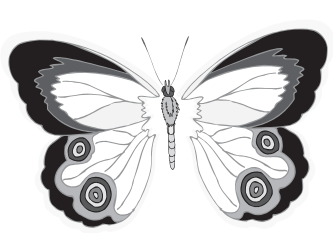
It takes around six to eight weeks for a butterfly to go through the stages of the life cycle.

Can you help the caterpillar find his way through the maze to become a butterfly?

Start



Finish



LIfe Cycle

Complete the maze.

The pupa is the third stage of the life cycle.

In the pupa stage, the caterpillar spins a pouch called a chrysalis..

The butterfly changes inside the chrysalis and stays for ten to fourteen days.

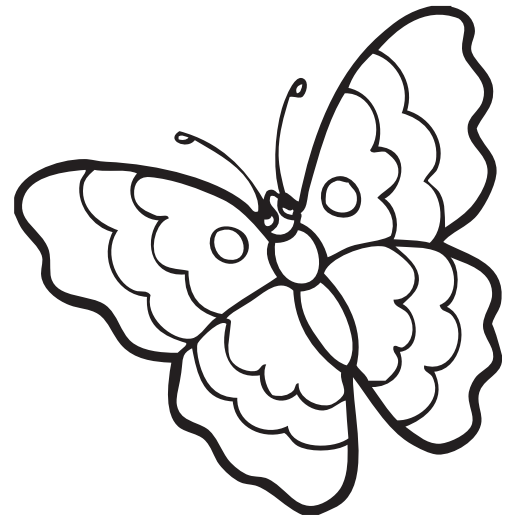
Just before the butterfly comes out, the wing patterns show through.

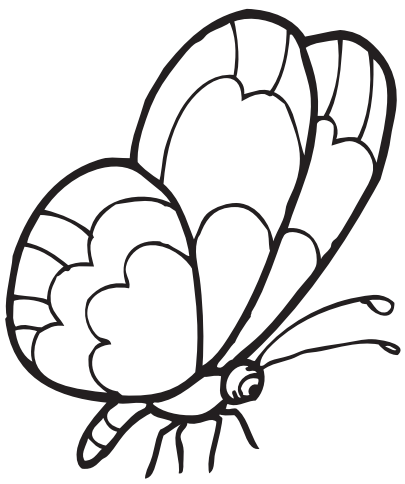
Pupa - Stage 3

Trace the dotted words.

The adult stage is the final stage.

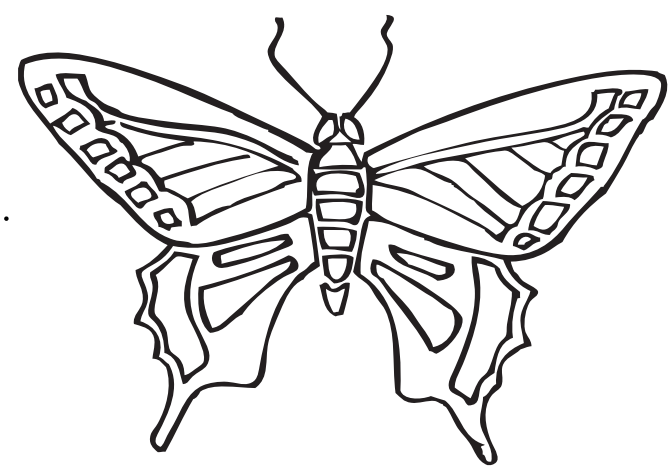
This is the stage the butterfly comes out as an adult.

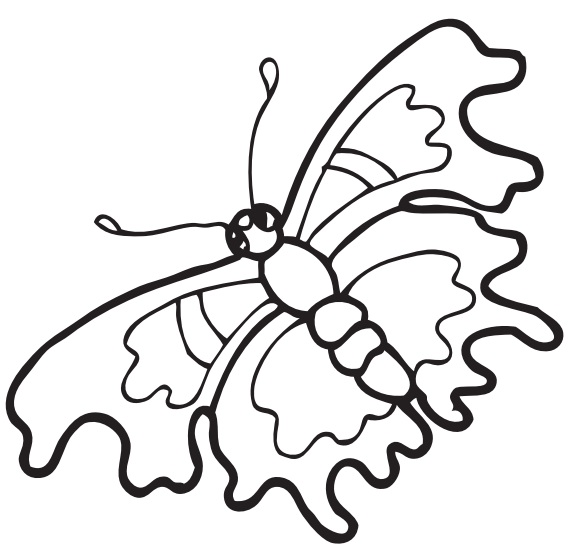




All butterflies have two pairs of wings covered with scales of different shapes, sizes, and colors.

Scales give butterflies their colors.





Adults in summer live from two to five weeks.

Adult - Stage 4

Trace the dotted words.

During the life cycle of a butterfly, there are many changes.

It starts out as an egg, then hatches into a caterpillar or larva.

The most changes happen in the pupa stage. When the caterpillar starts this third stage in the life cycle, it spins a silk pouch to protect it while it changes into a butterfly. This silk pouch is called a chrysalis and not a cocoon. As the butterfly comes out of the chrysalis, it takes several hours before it can fly.

The butterfly comes out as an adult. There is no such thing as a baby butterfly.

What is the third stage of the butterfly life cycle?

Pupa Larva Egg Adult

The adult stage of the butterfly life cycle is the _____ stage.

First Second Third Fourth

The _____ stage is when the caterpillar eats, and eats, and eats.

Pupa Larva Egg Adult

What is the third stage of the butterfly life cycle?

Pupa Larva Egg Adult

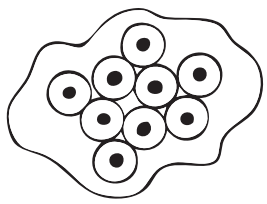
The adult stage of the butterfly life cycle is the _____ stage.

First Second Third Fourth

The _____ stage is when the caterpillar eats, and eats, and eats.

Pupa Larva Egg Adult

The following are the stages in the life cycle of a frog.

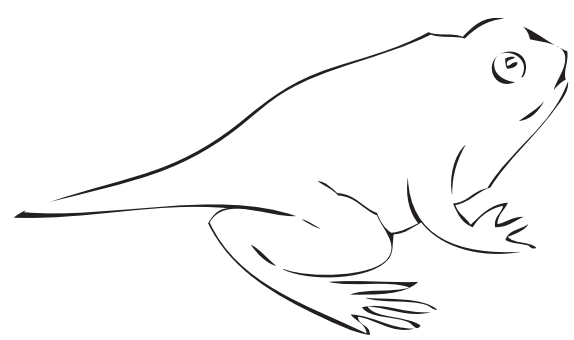


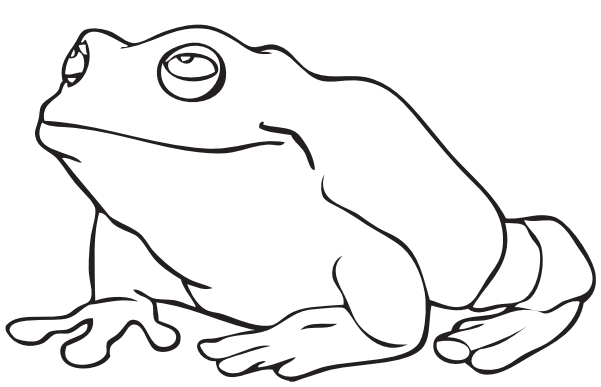
Egg – This is the first stage of the life cycle.

Tadpole- This is the second stage, where they breathe underwater and have a tail.

Tadpole with legs- This is the third stage in which the legs begin to form.

Froglet- This is the fourth stage, where the frog begins to breathe with lungs but still has some tail.



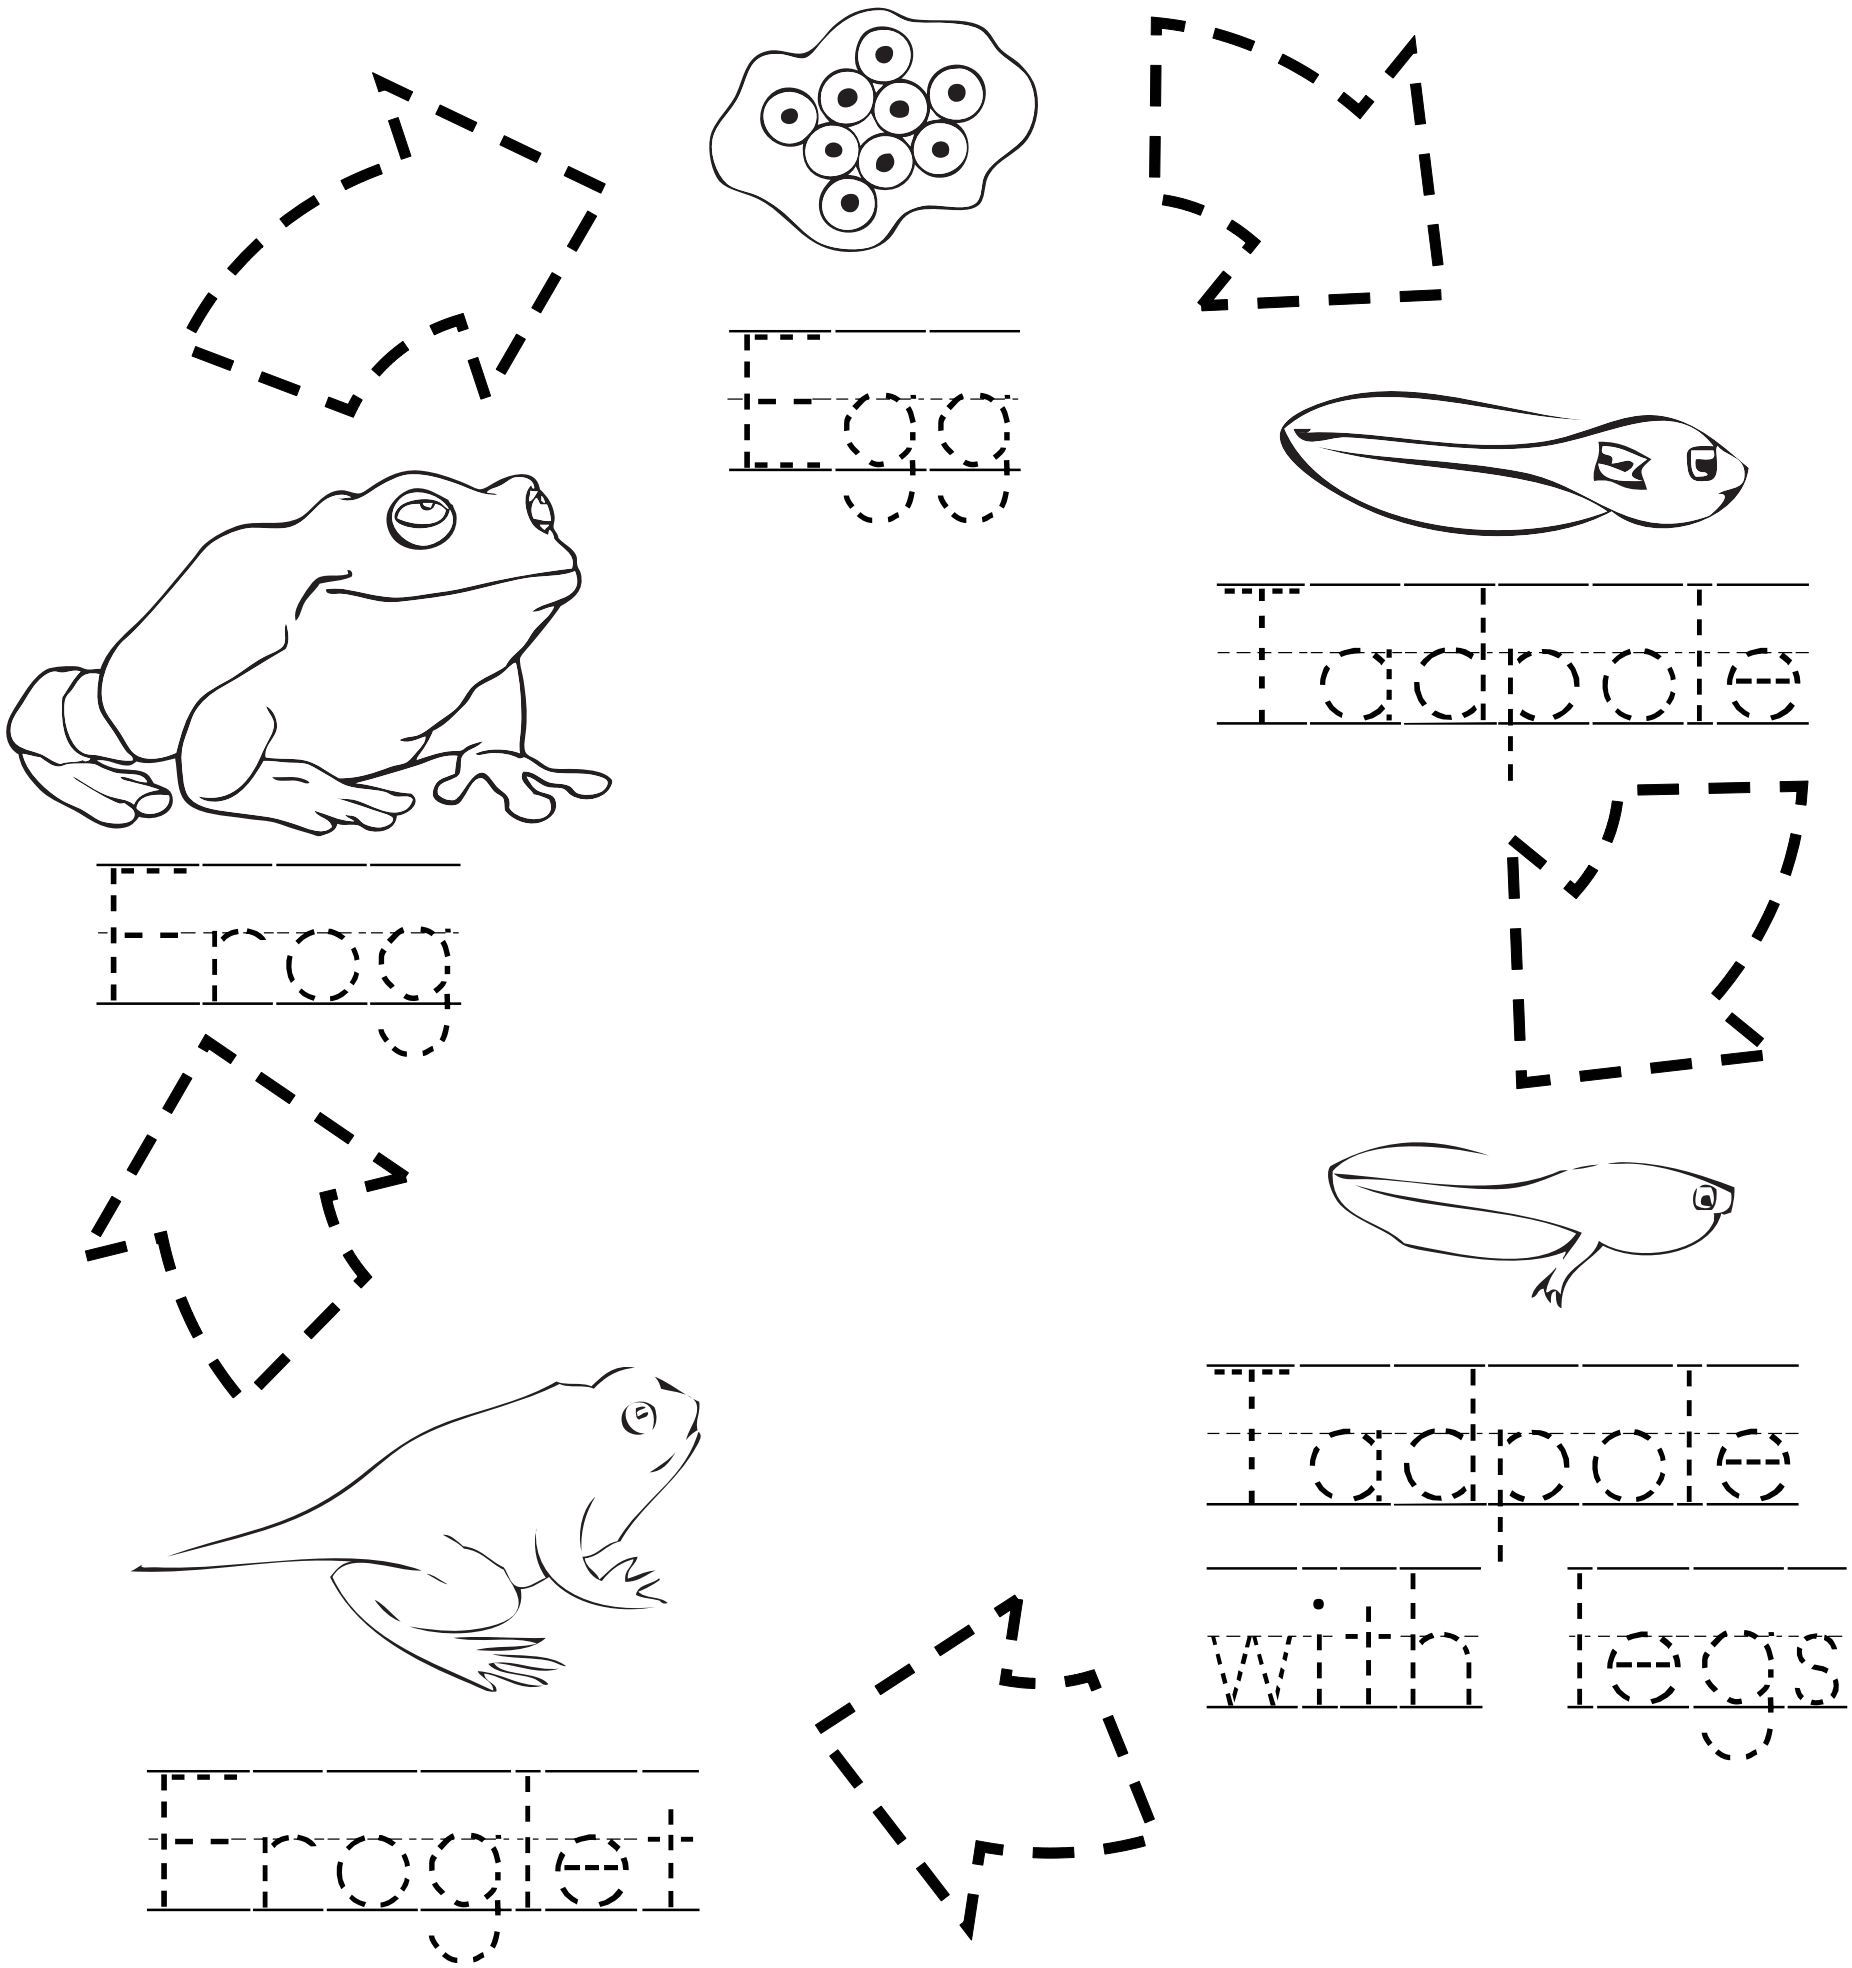


Adult- This is the fifth stage, where the frog no longer has a tail.

Frog Life Cycle

Read the information and trace the words.

The five stages in the frog life cycle are shown below.



Frog Life Cycle

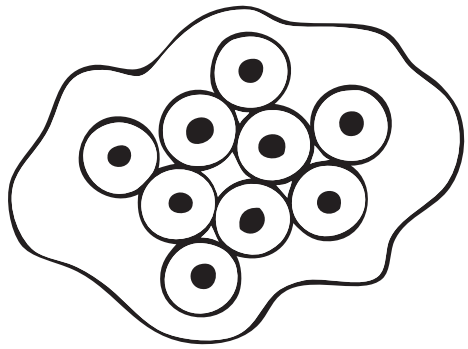
Trace the steps of the life cycle.

How many frogs can you find in the picture below?

Frogs

Count the number of frogs in the picture.

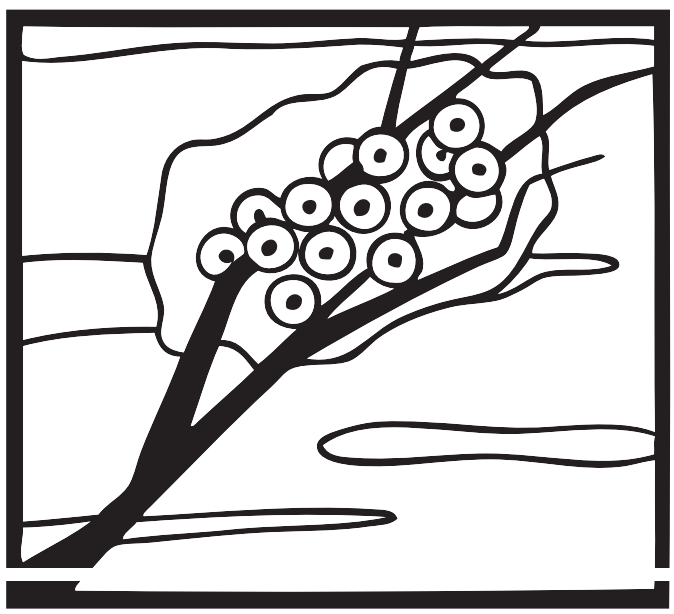
The egg is the first stage of the life cycle of a frog.



Frogs lay their eggs in water or wet places.

It is surrounded by a jelly-like covering, which protects the egg.

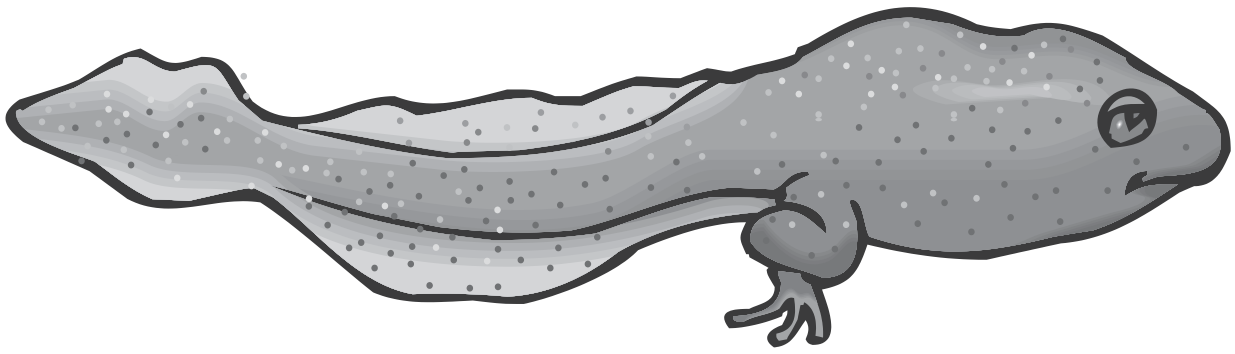
After 21 days the egg leaves the jelly shell and attaches itself to a weed in the water.



Egg - Stage 1

Read the information and trace the dotted words.

The tadpole is the second stage in the life cycle.



Tadpoles have a long tail, live in the water, and eat very small plants.

Tadpoles breathe underwater through gills, like fish.

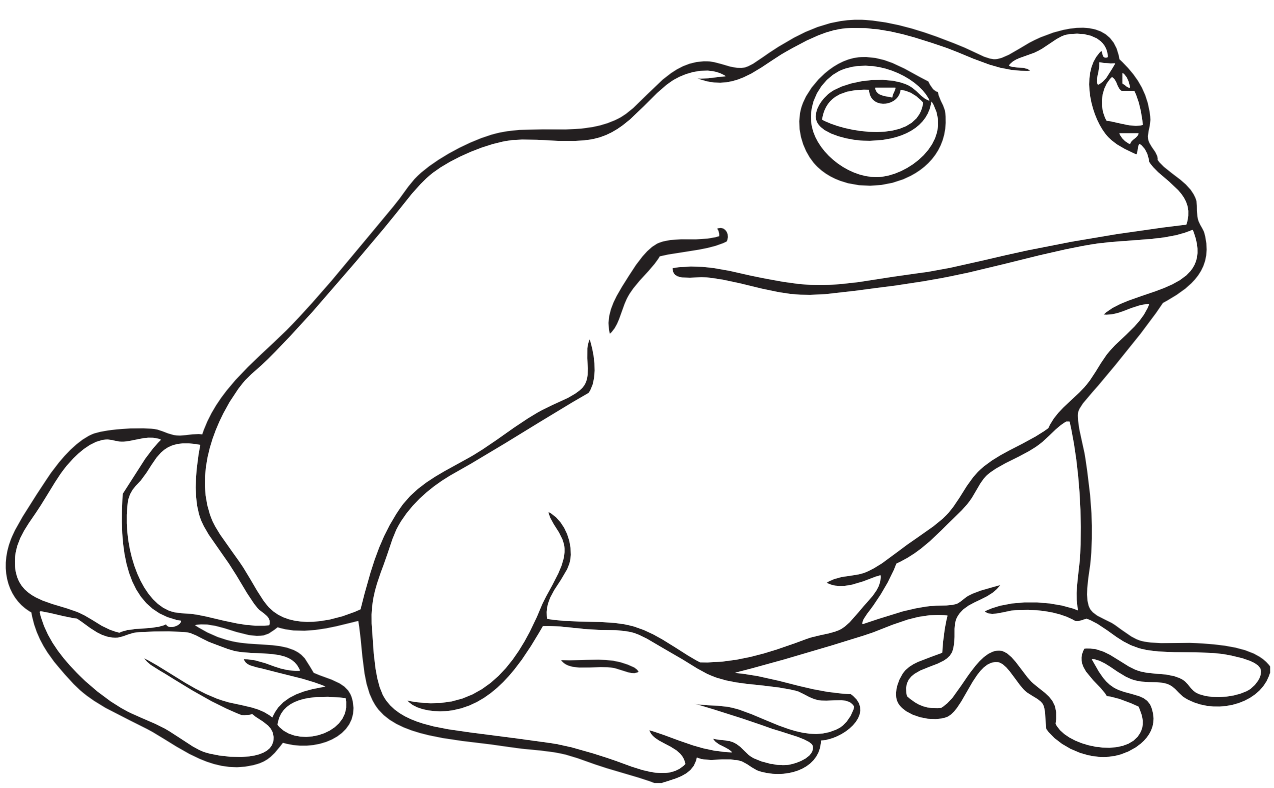
Frogs stay in this stage for about five weeks.

Tadpole - Stage 2

Read the information and trace the dotted words.

insects	
grow	**eggs**

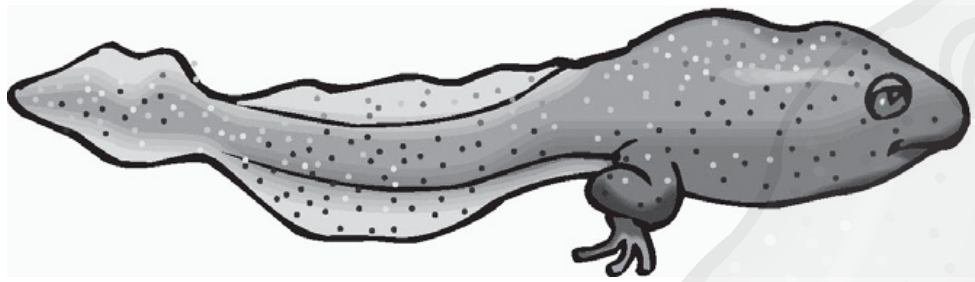
When a female frog lays her _____ , she sometimes stays with the eggs to take care of the young. Many of the frog eggs never _____ into adult frogs because they are eaten by other animals. Once the frog grows into an adult, it will eat _____ and worms.



Frogs

Use the Word Bank to complete the sentences.

The third stage in the life cycle of a frog is a tadpole with legs.



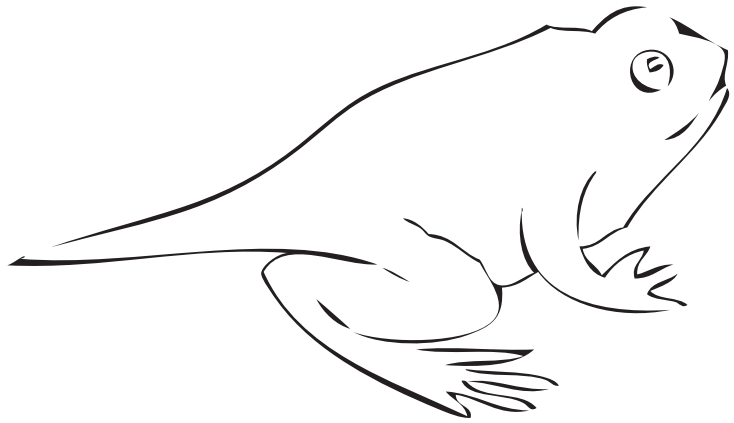
In this stage, the tadpole begins to grow back legs, then front legs.

The tadpole with legs begins to develop lungs, but still breathes under the water.

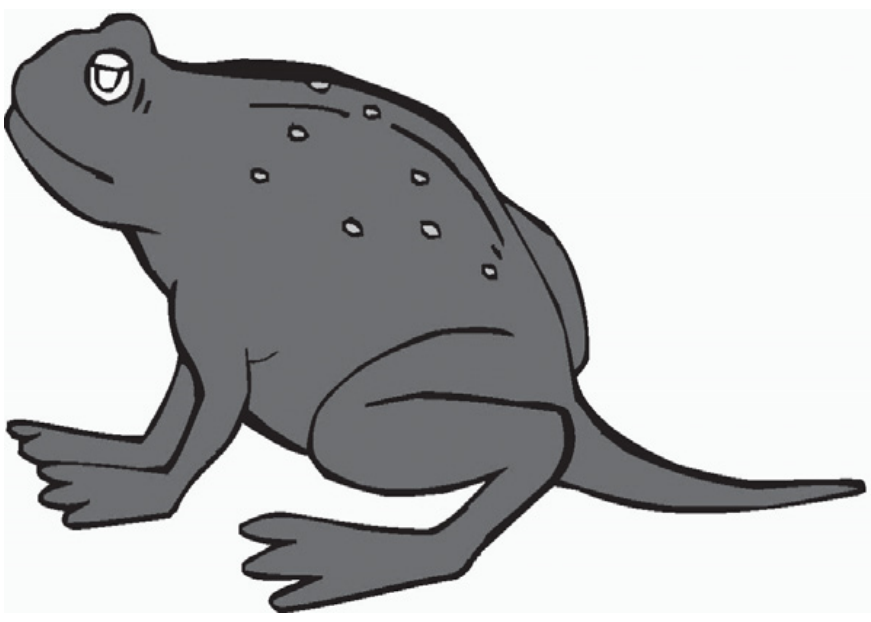
Tadpole with Legs - Stage 3

Read the information and trace the words.

The froglet is the fourth stage in the life cycle of a frog.



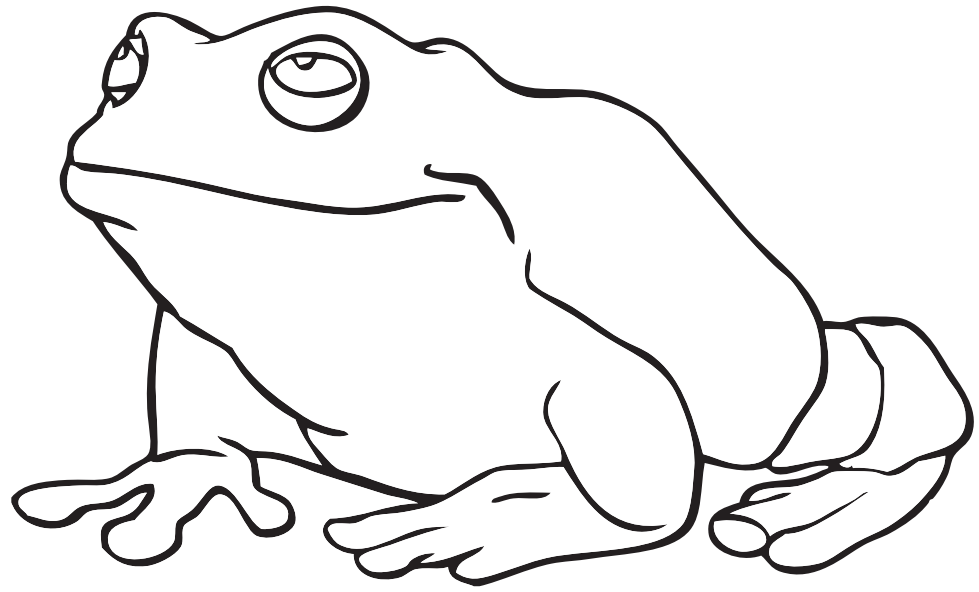
In the froglet stage, the frog begins to breathe through its lungs and lives mostly on land. In this stage, the froglet sheds its skin and tips. Its mouth widens and its head grows larger.



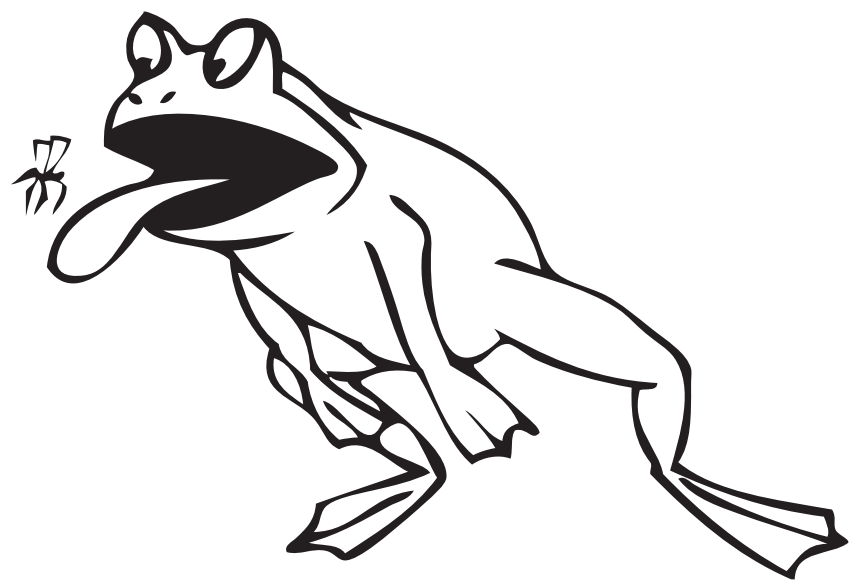
Froglet - Stage 4

Read the information and trace the words.

The last stage in the life cycle of a frog is the adult stage.

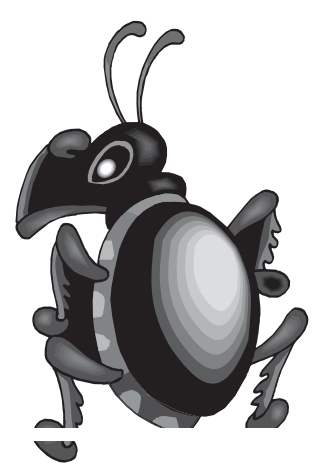


The adult frog lives mostly on land and does not have a tail.



It takes eleven weeks, for the frog to grow from an egg into an adult frog.

Adult frogs eat insects, and worms.



Frog - Stage 5
